## New Features in Vault V11 API (11.0.0 Release)

*Release Date: March 6, 2015*

We are pleased to bring you the following enhancements to the V11 API in this week's release. Refer to the [Vault Release Notes](#) for additional information about the 11.0.0 release.

### SAML Authentication

The API now supports user authentication via SAML. Having a valid SAML Assertion, applications are able to authenticate users to the API without having to provide their username and password. To accomplish this, applications can POST the SAML Assertion into the Vault ACS URL, including "vaultDNS" parameter containing the DNS of the vault to which the user needs to log in. The user receives a valid API Session ID which they can use to interact with the API.

### Updates to Documents API & Initiate Lifecycle Actions API

Vaults with **Approved Email integration** now include the *master\_email\_fragment\_v* document type. When retrieving available document lifecycle actions, the response now includes the *createEmailFragment* lifecycle action type. The new document type is assigned to documents which serve as a template for automatically generating

Feedback

*email\_fragment\_\_v* document types from any available document in Vault. To assign a **Master Email Fragment** and create an **Email Fragment** from a document, the request must contain the document id, version, and the *master\_email\_fragment\_document\_id\_\_v* lifecycle action entry requirement value.

## Opt-In for Veeva Emails

Veeva periodically sends product announcement emails to users (upcoming webinars for releases, etc.) and system availability (service unavailable during upgrade, etc.). API users can now manage email communications through the Vault Users API. Two new fields are exposed in user metadata: *send\_product\_announcement\_\_v* and *send\_system\_announcements\_\_v*. These can be set to true or false to enable or disable email communications.

If no value is provided and the security profile is one of *Vault Owner*, *System Admin*, or *Business Admin*, the value is set to “true” by default. All other security profiles have default values set to “false”. Values can also be set in the UI for users with access to their user profile.

## Query API Relevancy Sorting

When performing keyword searches using the FIND command in VQL, Vault now allows you to sort the results by relevancy. To sort results by relevancy, include “ORDER BY RANK” in the query string. More information is found in [Query Syntax & Structure](#).

## Updates to Documents API

Standard document fields for the *product\_\_v* and *country\_\_v* objects may include up to 50 object records. Standard document fields for all other Vault objects may now include up to 200 object records.

## Updates to Displayed Files on the FTP Staging Server

The Vault FTP staging server now lists up to 64,998 files. You can still upload any number of files.

## Notable API Fixes

Issue	Description
DEV-55142	When performing a query via the API, some document checksum values ( <i>md5checksum__v</i> ) return a null result.
DEV-57338	When performing a query via the API, Vault returns an error when the document ID field is entered in uppercase characters. With this fix, the document ID field can be entered in upper or lower case.
