## New Features in Vault V7.0 API (6.5.1 Release)

*Release Date: June 28, 2013*

We are pleased to bring you the following enhancements to the V7.0 API in this week's release.

### Create Draft

The Document API now allows users to create new document drafts from either the existing source document or by uploading a new file. To accomplish this, users can utilize the new query string parameter *createDraft* on an existing document API endpoint. Setting this parameter to *latestContent* creates a new draft from the latest version of the document's source file. Setting the parameter to *uploadedContent* requires a new file to be uploaded for the new draft.

### Role Restrictions on Start Workflow

The Initiate Lifecycle Action API now enforces role restrictions for lifecycle actions of type *workflow*. This enhancement provides an extra level of validation to ensure that only allowed users are able to participate in the document workflow.

### Updated User API

 Feedback

The User object now exposes two extra properties: Company (*company\_v*) and Groups (*groups\_v*). Its metadata now dynamically provides details on which fields are editable, based on the type of the account that is managing the user object through the API.

## Custom Help on Document Properties

The Document Metadata API now exposes the custom help text on properties. If defined, the property metadata definition will include the *helpContent* metadata field containing a help string.

## Change Password

The User API now allows users to change their passwords. A new endpoint, */password*, under the User object will accept the old and the new passwords to accomplish this. The password change takes effect immediately.

## API Bug Fixes

Issue	Description
6150	The offset keyword now properly offsets the starting result in the resultSet of the Workflow objects in a VQL Query.
16682	VQL queries which filter workflow objects based on workflow type “Read and Understood” now return proper results.
16914	Creating a group with an invalid user through the API now produces the proper error response and causes the group to not be created.
